Power BI - DAX - p4

Calculate(Expression , Filter);

Based on situation.

Existing measure.

Changing the name

```
Total Order Quantity = SUM('Sales Record 2020-2022'[OrderQuantity])
```

```
Total Orders = DISTINCTCOUNT('Sales Record 2020-2022'[OrderNumber])
```

DAX MEASURE TOTALS

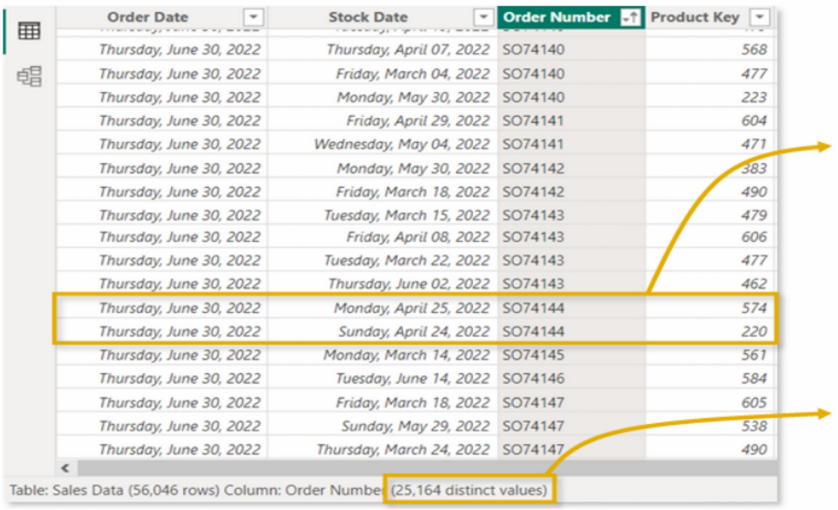
Measure totals may seem incorrect or inconsistent depending on how they are calculated, because they don't simply add up the visible values in the report

```
1 Total Orders =
2 DISTINCTCOUNT(
3     'Sales Data'[Order Number]
4 )
```

[Total Orders] counts distinct orders in the Sales Data table

Total Returns look right, but shouldn't Total Orders be 37,888??

Category Name	Total Returns	Total Orders
Accessories	1,115	16,983
Bikes	427	13,929
Clothing	267	6,976
Total	**1,809**	**25,164**



Order Date	Stock Date	Order Number	Product Key
Thursday, June 30, 2022	Thursday, April 07, 2022	SO74140	568
Thursday, June 30, 2022	Friday, March 04, 2022	SO74140	477

Thursday, June 30, 2022	Thursday, March 24, 2022	SO74147	490

Table: Sales Data (56,046 rows) Column: Order Numbe (25,164 distinct values)

Order SO74144 included two products: a bike and a helmet. That counts as 1 distinct order for the Total and 1 distinct order for BOTH Accessories & Bikes

With no filter context, there are 25,164 total distinct orders

PRO TIP:
Understand EXACTLY how your measures calculate and what they are designed to measure

```
1 Bike Return Qty = CALCULATE([Return Qty] , 'Product Categories Lookup'[CategoryName] = "Bikes")
```

CategoryName	Total Returns	Total Order Quantity	Return Rate	Return Qty	Bike Return Qty
Components					429
Clothing	269	12,436	2.16%	269	429
Bikes	429	13,929	3.08%	429	429
Accessories	1130	57,809	1.95%	1,130	429
Total	**1828**	**84,174**	**2.17%**	**1,828**	**429**

ASSIGNMENT: CALCULATE

1. Create a new measure named Bike Returns to calculate the total quantity of bikes returned.

2. Create a matrix to show Bike Returns (values) by Start of Month (rows). What do you notice about the volume of bike returns over time?

3. Create a new measure named Bike Sales to calculate the total quantity of bikes sold, and add it to the matrix. What do you notice?

4. Create a new measure named Bike Return Rate using either CALCULATE or DIVIDE, and add it to the matrix

5. How would you respond to the Product VP's concerns about rising bike returns?

```
Bike Return Qty = CALCULATE([Return Qty] , 'Product Categories Lookup'[CategoryName] = "Bikes")
```

Total Returns	Total Order Quantity	Return Rate	Return Qty	Bike Return Qty
				429
269	12,436	2.16%	269	429

Year	Bike Return Qty	Bike Sales
2020	86	2630
2021	172	5610
2022	171	5689
Total	**429**	**13929**

```
Bike Sales = CALCULATE([Total Order Quantity] , 'Product Categories Lookup'[CategoryName]  = "Bikes")
```

Total Returns	Total Order Quantity	Return Rate	Return Qty	Bike Return Qty
				429
269	12,436	2.16%	269	429
429	13,929	3.08%	429	429

Year	Bike Return Qty	Bike Sales
2020	86	2630
2021	172	5610
2022	171	5689
Total	**429**	**13929**

```
1 Bike Return Rate = DIVIDE([Bike Return Qty] , [Bike Sales])
```

Year	Bike Return Qty	Bike Sales	Bike Return Rate
2020	86	2630	3.27%
2021	172	5610	3.07%
2022	171	5689	3.01%
Total	**429**	**13929**	**3.08%**

```
1 All Orders = CALCULATE([Total Orders] , ALL('Sales Record 2020-2022'))
```

25K
Total Orders

25K
All Orders

CategoryName	Total Returns	Total Order Quantity	Return Rate	Return Qty	Bike Return Qty	Total Orders	All Orders
Components					429		25164
Clothing	269	12,436	2.16%	269	429	6976	25164
Bikes	429	13,929	3.08%	429	429	13929	25164
Accessories	1130	57,809	1.95%	1,130	429	16983	25164
Total	**1828**	**84,174**	**2.17%**	**1,828**	**429**	**25164**	**25164**

ALL

ALL() :-
Returns all rows in a table, or all values in a column, ignoring any filters that have been applied.

=ALL(Table or Column, [Column2], [Column3],...)

The table or column that you want to clear filters on
Examples:
- Transactions
- Products[Category]

Additional columns that you want to clear filters on (optional)
- Cannot specify columns if your first parameter is a table
- All columns must include the table name and come from the same table

Examples:
- 'Customer Lookup'[City], 'Customer Lookup'[Country]
- Products[Product Name]

PRO TIP:
Instead of adding filter context, the ALL function removes it. This is often used in "% of Total" calculations, when the denominator needs to remain fixed regardless of filter context.

```
All Orders =
    CALCULATE(
        [Total Orders],
        ALL(
            'Sales Data'))
```

```
% of All Orders =
    DIVIDE(
        [Total Orders],
        [All Orders])
```

```
Overall Average Price =
    CALCULATE(
        [Average Retail Price],
        ALL(
            'Product Lookup'))
```

CategoryName	Weekend Orders	Total Orders	All Orders	% of All Orders	Average Retail Price	Overall Average Price
		1	25,165	0.00%		$714.44
Accessories	4,913	16,983	25,165	67.49%	$34.26	$714.44
Bikes	3,995	13,929	25,165	55.35%	$1,541.38	$714.44
Clothing	1,962	6,976	25,165	27.72%	$50.68	$714.44
Components			25,165		$432.19	$714.44
Total	**7,214**	**25,165**	**25,165**	**100.00%**	**$714.44**	**$714.44**

ASSIGNMENT: CALCULATE & ALL

1.Create a new measure named All Returns to calculate the total number of returns, regardless of filter context

2. Create a new measure named % of All Returns that divides Total Returns by All Returns

3.Create a matrix to show % of All Returns (values) by product Category Name (rows). Which category accounts for the largest percentage of returns? The smallest?

```
All Returns =
    CALCULATE(
        [Total Returns],
        ALL(
            'Returns Data'))
```

```
% of All Returns =
    DIVIDE(
        [Total Returns],
        [All Returns])
```

CategoryName	Total Returns	All Returns	% of All Returns
		1,809	
Accessories	1,115	1,809	61.64%
Bikes	427	1,809	23.60%
Clothing	267	1,809	14.76%
Components		1,809	
Total	**1,809**	**1,809**	**100.00%**

FILTER

FILTER() :-
Returns a table that represents a subset of another table or expression

=FILTER(Table, FilterExpression)

Table to be filtered
Examples:
- Territory Lookup
- Customer Lookup

A Boolean (True/False) filter expression to be evaluated for each row of the table
Examples:
- 'Territory Lookup'[Country] = "USA"
- Calendar[Year] = 1998
- Products[Price] > [Overall Avg Price]

HEY THIS IS IMPORTANT!

- FILTER is used to add new filter context, and can handle more complex filter expressions than CALCULATE (by referencing measures, for example)

- Since FILTER returns an entire table, it's often nested within other functions, like CALCULATE or SUMX

PRO TIP:
- Since FILTER iterates through each row in a table, it can be slow and computationally expensive; only use FILTER if a simple CALCULATE function won't get the job done!

```
High Ticket Orders =
    CALCULATE(
        [Total Orders],
        'Product Lookup'[ProductPrice] > 714.44 ))
```

Instead of calling the hard coded value, we must use some filter function to calculate the values row basis.

```
High Ticket Orders =
    CALCULATE(
        [Total Orders],
        FILTER(
            'Product Lookup',
            'Product Lookup'[ProductPrice] > [Overall Average Price]))
```

CategoryName	Weekend Orders	Total Orders	All Orders	% of All Orders	Average Retail Price	Overall Average Price	High Ticket Orders
		1	25,165	0.00%		$714.44	
Accessories	4,913	16,983	25,165	67.49%	$34.26	$714.44	
Bikes	3,995	13,929	25,165	55.35%	$1,541.38	$714.44	11312
Clothing	1,962	6,976	25,165	27.72%	$50.68	$714.44	
Components			25,165		$432.19	$714.44	
Total	**7,214**	**25,165**	**25,165**	**100.00%**	**$714.44**	**$714.44**	**11312**

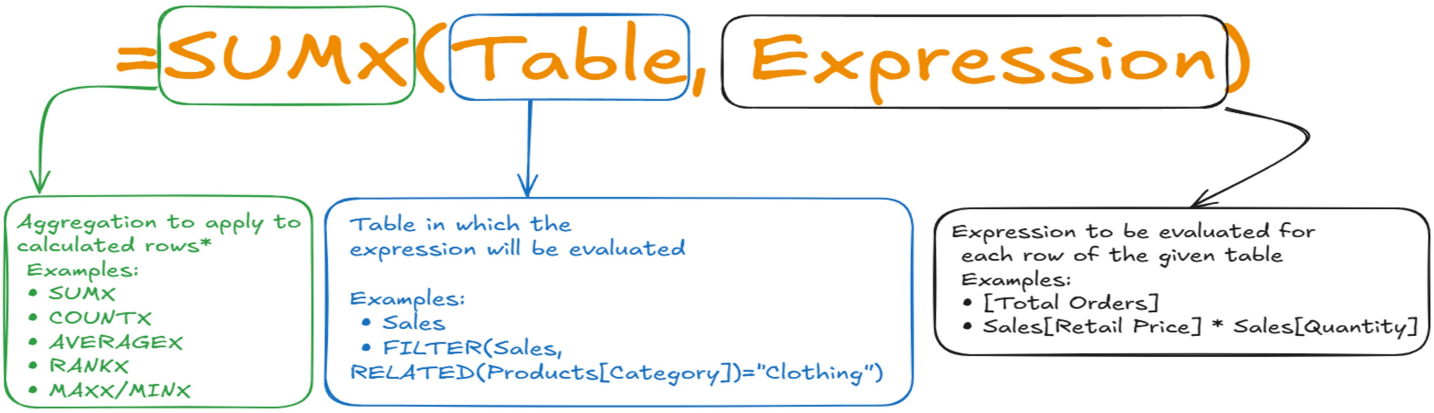
  [ProductPrice]))
```

$24.91M
Total Revenue

ITERATOR FUNCTIONS

Iterator (or "X") functions allow you to loop through the same expression on each row of a table, then apply some sort of aggregation to the results (SUM, MAX, etc.)



PRO TIP:
• Imagine that iterator functions add a temporary new column to a table, calculate a value in each row based on the given expression, then aggregate the values within that temporary column (similar to SUMPRODUCT in Excel).

Product Price	Quantity	Overall Price
100	10	1,000
200	5	1,000
400	5	2,000
500	2	1,000
1000	1	1,000

= 6,000

Total Cost = (100 * 10) + (200* 5) + (400 * 5) + (500*2) + (1000 * 1) = 6,000

```
Total Revenue =
    SUMX(
        'Sales Data',
        'Sales Data'[OrderQuantity] *
        RELATED(
            'Product Lookup'[ProductPrice]))
```

ASSIGNMENT: ITERATORS

1. Create a new measure named Total Cost that multiplies the order quantities in the Sales Data table by the product cost in the Product Lookup table, then calculates the sum

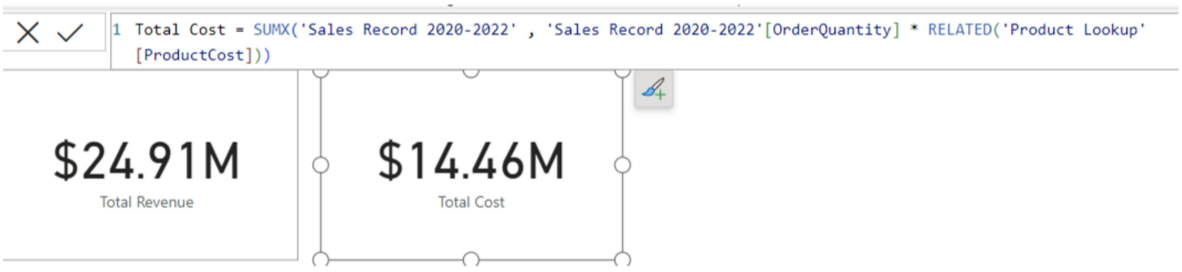
```
Total Cost =
    SUMX(
        'Sales Data',
        'Sales Data'[OrderQuantity] *
        RELATED(
            'Product Lookup'[ProductCost]))
```

2. Create a new measure named Total Profit (revenue minus cost)

```
Total Profit =
    [Total Revenue] - [Total Cost]
```

3. Create a matrix to show Total Profit (values) by Year (rows). How much profit has AdventureWorks earned so far in 2022?

Year	Total Revenue	Total Cost	Total Profit
2020	$64,04,933.58	$38,03,328.35	$26,01,605.23
2021	$93,24,203.79	$53,57,171.92	$39,67,031.87
2022	$91,85,449.45	$52,96,486.05	$38,88,963.40
Total	**$2,49,14,586.82**	**$1,44,56,986.32**	**$1,04,57,600.50**



10 20 30 40 50 60 70 80 90 100 110 120 130 140 150

```
YTD Revenue = CALCULATE([Total Revenue] , DATESYTD('Calendar Lookup'[Date]))
```

TIME INTELLIGENCE

Time Intelligence patterns are used to calculate common date-based comparisons

Performance To-Date

```
=CALCULATE(Measure, DATESYTD(Calendar[Date]))
```

Use DATESYTD for Years, DATESQTD for Quarters, DATESMTD for Months.

Previous Period

```
=CALCULATE(Measure,
DATEADD(Calendar[Date], -1, MONTH))
```

Select an interval (DAY, MONTH, QUARTER, or YEAR) and the # of intervals to compare (e.g. previous month, rolling 10-day)

Running Total

```
=CALCULATE(Measure,
DATESINPERIOD(Calendar[Date],
MAX(Calendar[Date]), -10, DAY))
```

PRO TIP:
To calculate a moving average, use the running total calculation above and divide by the number of intervals

```
YTD Revenue =
    CALCULATE(
        [Total Revenue],
        DATESYTD(
            'Calendar Lookup'[Date]
        )
    )
```

Year	Total Revenue	YTD Revenue
2020	**$64,04,934**	**$64,04,934**
January	$5,85,313	$5,85,313
February	$5,32,226	$11,17,539
March	$6,43,436	$17,60,975

December	$5,63,762	$64,04,934
Total	**$2,49,14,587**	**$91,85,449**

```
Previous Month Revenue =
    CALCULATE(
        [Total Revenue],
        DATEADD(
            'Calendar Lookup'[Date],
            -1,
            MONTH))
```

```
DATEADD(Dates, NumberOfIntervals, Interval)
```

Moves the given set of dates by a specified interval.

DAX BEST PRACTICES

Know when to use calculated columns vs. measures

- Use calculated columns for filtering, and measures for aggregating values

Use explicit measures, even for simple calculations

- Explicit measures can be referenced anywhere, and nested within other measures

Use fully-qualified column references in measures

- This makes your DAX more readable, and differentiates column references from measure references

Move column calculations "upstream" when possible

- Adding calculated columns at the source or in Power Query improves report speed and efficiency

Minimize the use of "expensive" iterator functions

- Use iterators with caution, especially if you are working with large tables or complex models
